Report 03/12/2020

1 Time independent control

We have the following OCP:

$$J = \frac{1}{2} \int_0^T \int_{\Omega} (\rho - \widehat{\rho})^2 dr dt + \frac{\beta}{2} \int_{\Omega} \mathbf{w}(r)^2 dr$$
 subject to:

$$\frac{\partial \rho}{\partial t} = \nabla^2 \rho - \nabla \cdot (\rho \mathbf{w}(r))$$

Then the Lagrangian is:

$$\mathcal{L}(\rho, \mathbf{w}, q) = \frac{1}{2} \int_0^T \int_{\Omega} (\rho - \widehat{\rho})^2 dr dt + \frac{\beta}{2} \int_{\Omega} \mathbf{w}(r)^2 dr - \int_0^T \int_{\Omega} q \frac{\partial \rho}{\partial t} - q \nabla^2 \rho + q \nabla \cdot (\rho \mathbf{w}) dr dt.$$

And after integrating by parts (neglecting the BCs because we know them already):

$$\mathcal{L}(\rho, \mathbf{w}, q) = \frac{1}{2} \int_0^T \int_{\Omega} (\rho - \widehat{\rho})^2 dr dt + \frac{\beta}{2} \int_{\Omega} \mathbf{w}(r)^2 dr$$
$$- \int_0^T \int_{\Omega} q \frac{\partial \rho}{\partial t} - q \nabla^2 \rho - \rho \mathbf{w} \cdot \nabla q dr dt.$$

Taking derivatives with respect to w gives:

$$\mathcal{L}(\rho, \mathbf{w}, q) = \int_{\Omega} \beta \mathbf{w}(r) \cdot \mathbf{h}(r) dt + \int_{0}^{T} \int_{\Omega} \rho \mathbf{h}(r) \cdot \nabla q dr dt.$$

Since w does not depend on t, neither does h and so this can be taken out of the time integral:

$$\mathcal{L}(\rho, \mathbf{w}, q) = \int_{\Omega} \left(\beta \mathbf{w}(r) \cdot \mathbf{h}(r) + \mathbf{h}(r) \cdot \int_{0}^{T} \rho \nabla q dt \right) dr.$$

Then we get:

$$\beta \mathbf{w}(r) + \int_0^T \rho \nabla q dt = 0$$

And finally:

$$\mathbf{w}(r) = -\frac{1}{\beta} \int_0^T \rho \nabla q dt$$

2 V_{ext} control

We have the following OCP:

$$J = \frac{1}{2} \int_0^T \int_{\Omega} (\rho - \widehat{\rho})^2 dr dt + \frac{\beta}{2} \int_0^T \int_{\Omega} V_{ext}^2 dr$$

subject to

$$\frac{\partial \rho}{\partial t} = \nabla^2 \rho + \nabla \cdot (\rho \nabla V_{ext})$$

The Lagrangian is:

$$\mathcal{L}(\rho, V_{ext}, q) = \frac{1}{2} \int_0^T \int_{\Omega} (\rho - \widehat{\rho})^2 dr dt + \frac{\beta}{2} \int_0^T \int_{\Omega} V_{ext}^2 dr - \int_0^T \int_{\Omega} q \frac{\partial \rho}{\partial t} - q \nabla^2 \rho - q \nabla \cdot (\rho \nabla V_{ext}) dr dt.$$

We need to integrate by parts twice to get the term in V_{ext} into the necessary form:

$$\int_{0}^{T} \int_{\Omega} q \nabla \cdot (\rho \nabla V_{ext}) dr dt = \int_{0}^{T} \int_{\partial \Omega} q \rho \nabla V_{ext} \cdot \mathbf{n} dr dt - \int_{0}^{T} \int_{\Omega} \rho \nabla V_{ext} \cdot \nabla q dr dt
= \int_{0}^{T} \int_{\partial \Omega} q \rho \nabla V_{ext} \cdot \mathbf{n} - \rho V_{ext} \nabla q \cdot \mathbf{n} dr dt + \int_{0}^{T} \int_{\Omega} V_{ext} \nabla \cdot (\rho \nabla q) dr dt$$

We will also have

$$\int_{0}^{T} \int_{\Omega} q \nabla^{2} \rho = \int_{0}^{T} \int_{\partial \Omega} q \nabla \rho \cdot \mathbf{n} - \rho \nabla q \cdot \mathbf{n} dr dt + \int_{0}^{T} \int_{\Omega} \rho \nabla^{2} q dr dt$$

2.1 Boundary Conditions

And the boundary conditions:

$$\int_{0}^{T} \int_{\partial \Omega} q_{\partial \Omega} \nabla \rho \cdot \mathbf{n} + q_{\partial \Omega} \rho \nabla V_{ext} \cdot \mathbf{n} dr dt$$

Combining these:

$$\int_{0}^{T} \int_{\partial\Omega} q\rho \nabla V_{ext} \cdot \mathbf{n} - \rho V_{ext} \nabla q \cdot \mathbf{n} + q \nabla \rho \cdot \mathbf{n} - \rho \nabla q \cdot \mathbf{n} + q_{\partial\Omega} \nabla \rho \cdot \mathbf{n} + q_{\partial\Omega} \rho \nabla V_{ext} \cdot \mathbf{n} dr dt$$

During the derivation of the adjoint equation we have:

$$\int_{0}^{T} \int_{\partial \Omega} \mathbf{n} \cdot h \left(q \nabla V_{ext} - V_{ext} \nabla q - \nabla q + q_{\partial \Omega} \nabla V_{ext} \right) + \nabla h \cdot \mathbf{n} \left(q + q_{\partial \Omega} \right) dr dt$$

Then from the ∇h terms we get $q_{\partial\Omega} = -q$ and so:

$$(q\nabla V_{ext} - V_{ext}\nabla q - \nabla q - q\nabla V_{ext}) \cdot \mathbf{n} = 0$$

And therefore:

$$(1 + V_{ext})\frac{\partial q}{\partial n} = 0$$

Can we divide by $1 + V_{ext}$, is $V_{ext} > 0$.

2.2 Gradient Equation

We take the derivative of the Lagrangian with respect to V_{ext} :

$$\mathcal{L}_{V_{ext}}(\rho, V_{ext}, q)h = \int_{0}^{T} \int_{\Omega} \beta V_{ext}h + \nabla \cdot (\rho \nabla q)h dr dt + \int_{0}^{T} \int_{\partial \Omega} (q\rho \nabla h - \rho h \nabla q - q\rho \nabla h) \cdot \mathbf{n} dr dt$$

The boundary conditions just give (as before) $\frac{\partial q}{\partial n} = 0$ since $\rho > 0$. (+++ We don't do this, do we? But it would support my hypothesis that $1 + V_{ext}$) > 0 +++) Then from the terms within the domain we have:

$$\beta V_{ext} + \nabla \cdot (\rho \nabla q) = 0$$

And finally

$$V_{ext} = -\frac{1}{\beta} \nabla \cdot (\rho \nabla q).$$

3 Target at final time

$$J = \frac{1}{2} \int_{\Omega} (\rho(T) - \widehat{\rho})^2 dr + \frac{\beta}{2} \int_0^T \int_{\Omega} \mathbf{w}^2 dr$$

subject to:

$$\frac{\partial \rho}{\partial t} = \nabla^2 \rho - \nabla \cdot (\rho \mathbf{w})$$

Then the Lagrangian is:

$$\mathcal{L}(\rho, \mathbf{w}, q) = \frac{1}{2} \int_{\Omega} (\rho(T) - \widehat{\rho})^2 dr + \frac{\beta}{2} \int_0^T \int_{\Omega} \mathbf{w}^2 dr - \int_0^T \int_{\Omega} q \frac{\partial \rho}{\partial t} - q \nabla^2 \rho + q \nabla \cdot (\rho \mathbf{w}) dr dt.$$

From integrating by parts we get:

$$\int_0^T \int_{\Omega} -q \frac{\partial \rho}{\partial t} dr dt = -\int_{\Omega} q(T)\rho(T) - q(0)\rho(0) dr + \int_0^T \int_{\Omega} \rho \frac{\partial q}{\partial t} dr dt$$

$$\mathcal{L}(\rho, \mathbf{w}, q) = \frac{1}{2} \int_{\Omega} (\rho(T) - \widehat{\rho})^2 dr + \frac{\beta}{2} \int_{0}^{T} \int_{\Omega} \mathbf{w}^2 dr - \int_{\Omega} q(T)\rho(T) - q(0)\rho(0)dr + \int_{0}^{T} \int_{\Omega} \rho \frac{\partial q}{\partial t} + q\nabla^2 \rho - q\nabla \cdot (\rho \mathbf{w}) dr dt.$$

Taking the derivative with respect to ρ gives:

$$\mathcal{L}_{\rho}(\rho, \mathbf{w}, q)h = \int_{\Omega} (\rho(T) - \widehat{\rho})h(T)dr - \int_{\Omega} q(T)h(T)dr + \int_{0}^{T} \int_{\Omega} h \frac{\partial q}{\partial t} + q\nabla^{2}h - q\nabla \cdot (h\mathbf{w})drdt.$$

Considering the terms for h(T) gives:

$$(\rho(T) - \widehat{\rho}) - q(T) = 0,$$

and so

$$q(T) = \rho(T) - \widehat{\rho}$$

The adjoint PDE remains unchanged, except for the fact that $\rho - \hat{\rho}$ does not enter the PDE anymore.

4 Sedimentation

I ran the two different configurations with N=100. I computed the mass in both cases and plotted the outcome. We can see that mass is still not constant but it is better than with N=70.

5 MultipleSpecies forward problem

The forward problem is showing weird oscillations. Maybe I implemented this incorrectly. Figure 7 shows what happens with diffusion only. Figure 8 and 9 shows what happens with advection in opposite direction, attraction to the own species and repulsion with the other
